IS THERE A WAY TO TIGHTEN LOOSE SKIN WITHOUT HAVING TO UNDERGO A SURGICAL FACELIFT?

Yes, Ultherapy is a nonsurgical treatment that uses ultrasound to actually lift loose or sagging skin on the neck, under the chin and above the eyebrows without any downtime.

WHAT IS UNIQUE ABOUT THE ULTHERAPY PROCEDURE?

Ultherapy is a noninvasive treatment that specifically targets the deep foundation below the skin that is addressed in cosmetic surgery without cutting or disrupting the surface of the skin. It is the only procedure to use ultrasound imaging, which allows us to actually see the layers of tissue we are targeting during treatment and ensure that energy is deposited precisely to where it will be most effective.

WHAT'S THE LATEST IN NONINVASIVE BODY CONTOURING?

CoolSculpting is a breakthrough, noninvasive procedure that uses cooling technology to noticeably eliminate fat without surgery. Our doctors will determine if you are a good candidate and work with you to determine the best treatment plan during a one-on-one consultation.

HOW DOES COOLSCULPTING WORK?

The FDA-cleared and patented procedure uses a targeted cooling process that kills the fat cells underneath the skin, literally freezing them to the point of elimination. Only fat cells are frozen. Your healthy skin cells remain, well, healthy. No knives. No suction hoses. No needles. No scars. Once crystallized, the fat cells die and are naturally eliminated from your body.
